Acknowledgments

The study was funded by the National Science Foundation by grants to the University of Michigan and Stanford University (grant nos. SES-1444721 and SES-1444910 respectively).

The study was designed, and data collection supervised, by the ANES Principal Investigators and staff with design input from the ANES advisory board and contributors to the ANES Online Commons. At the University of Michigan, Vincent Hutchings and Ted Brader were Principal Investigators. At Stanford University, Shanto Iyengar was Principal Investigator during the study's execution and Simon Jackman and Gary Segura were Principal Investigators during the study's conception and initial development.

Darrell Donakowski was study director for the face-to-face component and Matthew DeBell was Co-Investigator at Stanford University and study director for the Internet component. ANES staff on the project were Patricia Luevano, Jaime Ventura, Laurie Pierson, and Natalya Maisel.

Data collection was performed by Westat, Inc. Westat developed the sampling plan and collaborated with ANES personnel on other aspects of the study's technical design. Lead personnel on the project at Westat included Michelle Amsbary, Mike Brick, Shelley Brock, Rick Dulaney, Brad Edwards, Vanessa Meldener, Roger Tourangeau, and Siu Wan. The sampling frame was provided by Marketing Systems Group.

User's Guide and Codebook for the ANES 2016 Time Series Study

December 18, 2018 Release

This document is a brief guide and a codebook for the American National Election Studies (ANES) 2016 Time Series study, to accompany the re- release of the data in December 2018.

The ANES 2016 Time Series is a continuation of the series of election studies conducted by the ANES since 1948 to support analysis of public opinion and voting behavior in U.S. presidential elections. This year's study features a dual-mode design with both traditional face-to-face interviewing (n=1,180) and surveys conducted on the Internet (n=3,090), and a total sample size of 4,270. There is one less case with respect to previous releases of the 2016 Time Series Study. It was determined that one respondent was ineligible for the survey and that case has been deleted.

Current Release

This data release in December 2018 (version 20181218) replaces the previous, December 2017, release of the data. The current release mainly reflects the following additions or changes to the data file:

- Case ID variables have been revised. The original six digit Case ID variable from Westat has been renamed to V160001_orig. V160001 now reflects that traditional four digit convention for ANES Case IDs and matches the Case IDs found in the Cumulative Data File (VCF0006).
- Coded versions of the responses to the Most Important Problem questions have been added.
- Some cases in the following the religion variables have been recoded: V161248, V161249, V161251, V161252, V161256
- Some cases in the coded versions of the occupation and industry variables have been recoded to correct cases that should have been coded "refused" and "don't know" (V161282b, V161283b, V161291b, V161292b, V161301b)
- Variable V161317 has been recoded per the erratum notice from October 2, 2018.
- Some cases in the following post thermometer variables have been recoded due to a programming error that was discovered: V162082, V162084, V162086, V162088, V162090, V162091
- Religion and Hispanic origin summary variables have been added to the data set.
- Pre and post interview language variables have been added to the data set.
- Interview date and time data (V164002 to V164006 & V165002 to V165006) have been further revised to improve accuracy. Interview length variables for both the pre and post have been recalculated to reflect these changes.
- Randomization, Screener (FTF and Web), Interviewer Description, and Candidate & Races (House, Senate, Governor) variables have all been added.

If you find errors or have comments or questions about the data, please communicate with ANES staff

by writing to anes@electionstudies.org

Sample Design and Respondent Recruitment

The study has two independently drawn probability samples that describe approximately the same population. The target population for the face-to-face mode was 222.6 million U.S. citizens age 18 or older living in the 48 contiguous states of the USA or the District of Columbia, and the target population for the Internet mode was 224.1 million U.S. citizens age 18 or older living in the 50 US states or the District of Columbia. In both modes, the sampling frame was lists of residential addresses where mail is delivered, and to be eligible to participate, a respondent had to reside at the sampled address and be a U.S. citizen age 18 or older at the time of recruitment.

Face-to-face face mode. The sample for in-person interviews was a multi-stage stratified cluster sample. This is similar in general design but different in details from past designs of ANES Time Series studies. Sixty primary sampling units (PSUs) were selected from across the 48 contiguous states and Washington DC. The PSUs were counties, or combinations of counties to form a minimum population of 50,000, or, in the case of Los Angeles County, half-counties (i.e. L.A. County was divided into two PSUs due to its large size). Counties were stratified by Census region, prevalence of poverty and members of minority groups, and population size, and then selected at random with probability proportional to the number of adult citizens, except that Cook County, IL, Harris County, TX, Maricopa County, AZ, and both halves of Los Angeles, CA, were selected with certainty.

Within each PSU, four smaller areas were drawn (secondary sampling units, which were Census Block Groups), and households were selected at random from within these areas from the US Postal Service's computerized delivery sequence file (DSF). An advance letter was sent to each selected address that included a study brochure and \$5 in cash, after which an interviewer visited the address to complete a screening interview to randomly select one person to be interviewed from among the adult U.S. citizens living there. Those interviewed were given \$25 or \$50 during the initial phase of the field period (with \$50 offered in PSUs where predicted response propensity was low and \$25 offered elsewhere), escalating to \$100 after initial non-response.

During the last two weeks of data collection, subsampling was performed in which half of the remaining eligible cases from the face-to-face were dropped from the study to focus field efforts on the other half. The weights account for this subsampling by up-weighting the cases retained at this stage.

Internet mode. The sample for the Internet mode was a random draw from the DSF (excluding "drop point" addresses), with all included residential addresses across the 50 states and Washington DC having equal probability of selection. Selected addresses were sent a series of letters to recruit one household member to go online to complete a survey. The invitation letter included \$20 in cash and promised \$40 for completing a survey online (later escalated to \$80 for initial non-respondents). This online survey included a screening instrument to randomly select one person from among the adult U.S. citizens living at the address to complete the ANES questionnaire online and receive \$40 or \$80.

Mode sample differences. The face-to-face component of the study does not include respondents from Alaska or Hawaii; the Internet component does. This is the main substantive design difference in eligibility and coverage for the two modes and for most analytic purposes it is probably ignorable because the combined population of Alaska and Hawaii is less than 1 percent of the study population.

Data Collection

Field dates. The study interviewed respondents in a pre-election survey between September 7 and November 7, 2016. Election day was November 8. The study re-interviewed as many as possible of the same respondents in a post-election survey between November 9 and January 8, 2017.

Locations. In-person interviews were normally conducted in the respondent's homes, but were allowed to be conducted at any location that was convenient for the respondent. Internet questionnaires could be completed anywhere the respondent had access to the Internet, on a computer or on a mobile device.

Modes of administration. In-person interviews were conducted by trained interviewers using computer-assisted personal interviewing (CAPI) software on laptop computers. During a portion of the in-person interview, the respondent answered certain sensitive questions on the laptop computer directly, without the interviewer's participation (known as computer assisted self-interviewing). Respondents were only eligible to complete the survey in the mode for which they were sampled; no one sampled for the Internet study was interviewed by a live interviewer, and no one sampled for the face-to-face interview completed the study online.

Interview length. The pre-election and post-election questionnaires were designed for a median administration time of approximately 80 minutes each, not counting screening procedures.

Languages. Interviews in both modes were conducted in English or Spanish.

Response Rates

The response rate, using the American Association for Public Opinion Research (AAPOR) formula for the minimum response rate (known as AAPOR Response Rate 1) on the pre-election interview, was 50 percent for the face-to-face component and 44 percent for the Internet component. The response rate for the face-to-face component is weighted to account for subsampling during data collection; due to subsampling for the face to face mode, the unweighted response rate would not be meaningful. The re-interview rate on the post-election survey was 90 percent for the face-to-face component and 84 percent for the Internet component.

Pre-election interviews were considered sufficiently complete to be counted as completions for weighting and for calculation of the response rate when the survey was administered through the last item of the demographic section "DEM3." There were a 4,271 pre-election interviews.

Restricted Data Access

Some variables, including date of birth, the respondent's ZIP code, and answers to open-ended questions are coded "-3. Restricted access" on the public use dataset. Data for many of these variables can be obtained through a Restricted Data Access agreement. See the ANES website for more information. Redacted texts for non-confidential open-ends are available for download from the ANES 2016 Time Series study page.

Data Analysis, Weights, and Variance Estimation

The data can be analyzed using the combined dual-mode sample, or using the face-to-face sample

alone, or using the Internet sample alone. In the combined sample, the larger number of Internet sample cases makes that mode dominate the estimates by a ratio of about 3:1.

Analysis should be weighted to accurately represent the population. Sampling error calculations should account for the complex sample design and the effects of weighting on variance.

Weights

To analyze the complete dataset (both web and face-to-face modes) using variables from the post-election survey only or from both the pre-election and post-election questionnaires, use the weight V160102. For analysis of the complete dataset using only the pre-election questionnaire data, use the weight V160101.

The table below indicates the weight variable to use for different types of analysis.

<i>Weight</i>	<i>Use for analysis of the...</i>
V160102	full sample using post-election survey only or both pre and post
V160101	full sample using pre-election survey data only
V160102f	face-to-face mode alone, using the post-election survey or both pre and post
V160101f	face-to-face mode alone, using pre-election survey data only
V160102w	Internet mode alone, using data from both pre- and post-election or post alone
V160101w	Internet mode alone, using data from only the pre-election survey

Sampling errors and significance testing

The study is not a simple random sample, so statistical procedures for complex sample designs must be used to obtain correct estimates of sampling errors and correct indications of statistical significance. Statistical software such as Stata, *R* with a survey analysis package, or SPSS with the Complex Samples package can perform a Taylor Series calculation of sampling errors when provided with the appropriate strata and cluster variables. In Stata, the command to set up this type of analysis is as follows:

```
svyset [pweight=WEIGHT], strata(STRATA) psu(CLUSTER)
```

In the code example above, WEIGHT would be replaced with the correct weight for the type of analysis being performed (as indicated in the previous section on weighting). STRATA and CLUSTER would be replaced with the variables for the corresponding analysis as indicated below.

<i>Variable</i>	<i>Definition</i>
V160201	Stratum – Full sample
V160201f	Stratum – Face-to-face sample
V160201w	Stratum – Web sample
V160202	Variance PSU – full sample
V160202f	Variance PSU – Face-to-face sample
V160202w	Variance PSU – Web sample

For example, the code to set up Stata for an analysis of the full sample that includes one or more variables from the post-election survey is as follows:

```
svyset [pweight=V160102], strata(V160201) psu(V160202)
```

For more information about weighted analysis of ANES data, see DeBell, *How to Analyze ANES Survey Data*: <http://www.electionstudies.org/Library/papers/nes012492.pdf>

Orientation to the Data File

File formats

The data file is provided in three formats: Stata (.dta), SPSS (.sav), and ASCII format. The ASCII file uses a | (pipe or bar) delimiter. The “readme” file included with the ASCII data package describes how to use provided syntax files in Stata, SPSS, or SAS to build a data file. However, the complete Stata and SPSS datasets may also be downloaded directly from the ANES website.

Variables

There are 1,290 variables on the file. They are named with the numerical naming system common to most ANES data sets, such as V160001. An overview of the variables is as follows:

version. Describes the version of the dataset: ANES2016TimeSeries_20171219.

V160001. Case ID.

V160101 – V160202w. Weights.

V160501, V160502. Mode of interview and completion status.

V161001 – V161523. Pre-election interview.

V162001 – V162371b. Post-election interview.

V163001a – V163002. Sample.

V164001a – V164013. Pre-election administrative variables, such as time of interview.

V165001a – V165009. Post-election administrative variables.

V166001 – V166003. Randomization.

V167500 – V167558. Dwelling unit observations.

V168000 – V168132. Interviewer observations.

Missing data

Missing data are coded to indicate the reason they are missing, using the following codes and categories:

- 1. Inapplicable
- 2. Text responses available in separate file or coded version will be included in future release
- 3. Restricted
- 4. Error
- 5. Breakoff, sufficient partial IW
- 6. No post-election interview
- 7. No post data, deleted due to incomplete IW
- 8. Don't know
- 9. Refused

Codebook

The following pages contain entries for each variable on the data file. The heading on each page is the variable name. “Label” is the variable label; “Item name” is the name of the item on the questionnaire;

“Question” provides wording of the question asked. For continuous variables, an “Unweighted Summary” provides summary statistics for the face-to-face, web, and combined samples. For categorical variables, the numerical codes, value labels, and frequencies, and percentages are given. Note that the percentages give a percentage distribution across all values, including missing values. Weighted population estimates would exclude missing values from the denominator of the proportions, and as such the percentages given in the codebook generally do not constitute population estimates.

Item name: FACEBOOK_LOGINPLEA

Question: IF MODE IS WEB: IF R HAS A FACEBOOK ACCOUNT THAT R HAS USED IN THE PAST MONTH: IF R DID NOT LOG INTO FACEBOOK: We understand it is your choice not to share information about how you've used Facebook. Would you be willing to reconsider? To get an accurate picture of how all Americans use – or do not use Facebook, we need to include you. Any information you do share through Facebook would be stored separately from the rest of your survey responses. We would use the information to look at things like how many news stories about the presidential election appeared in people's Facebook feeds, and how many posts with references to political candidates they liked, and other general descriptions of Facebook feeds and profiles. And we would keep the information confidential. If you will log into Facebook, below, you can tell Facebook what information you are willing to give to Stanford University and the University of Michigan, or you
